

mila-wall (100 Series) General Operating Instructions

Step #1: Before setting up walls, lower adjustable leveling feet on each panel approximately 1". This will allow access to the threaded nut required to level the adjustable feet. (Use the leveling disc or open ended wrench).

Using the Leveling Disc:
Once walls are erected, slide disc over threaded portion of foot, lower onto nut and spin. Adjust feet until walls are level and secure.

Before Installation - REMEMBER:
Always think one panel ahead. Install the proper hardware on each panel to expedite the setup. All connection hardware is interchangeable!

Step 2: Begin by erecting a self-supporting corner wall section using a corner profile.

Using a Corner Profile:
Insert profile into edge of panel and tighten set screws located in each corner, beneath the surface covering of each wall module using the 3mm allen wrench (Refer to Diagram Below).

Using a End Cover Profile:
To finish edges of panels, use end cover profiles by snapping Clip #1's into edge of module (position every 12" to 15" apart), end cover profiles snap onto Clip #1's.

Clip #1

End Cover Profile

Step #3: Instruction for panel to panel connection (not using a corner profile):
* Attach Rigid Panel Fastener at the Bottom of the mila-wall module that is already erected (refer to diagram).
* Attach Rigid Panel Fastener (at the Top) and Tongue profile in the mila-wall module that will be installed.
LINE UP WALL MODULE, LIFT AND LOWER. Adjust leveling feet until panels are level & secure.
PLEASE NOTE: There is No Need to tighten set-screws for this type of panel connection.
